

[Mac] Compiler internal error. Process terminated with exit code 139

This problem is caused by the **Instant Hijack** from rogueamoeba.com. This is an add-on for Airfoil and other applications from rogue amoeba (such as nicecast).

The solution is to stop the service with

```
sudo /usr/local/hermes/bin/hermesctl unload
```

IntelliJ IDEA 7.0 and 8.0 versions running on Intel Macs are affected when JDK 1.6 is installed.

There are also two other workarounds for this bug. Note that they may not work in your particular environment.

1. Run IntelliJ IDEA from the Terminal, using the command like: `open /Applications/IntelliJ\ IDEA\ 8.0.app/` (the actual path may vary depending on your IntelliJ IDEA version and installation location). Starting IntelliJ IDEA by clicking on the Contents/MacOS/idea file (under the IntelliJ IDEA app directory) in **Finder** is also known to solve the problem.
2. Open Settings | Compiler dialog and add the `-J-d32` to the **Additional command line parameters** field. It may not work if JDK 1.5 is used as a target. Try using JDK 1.6 as a project JDK and see if it helps (remove other JDK configurations from IntelliJ IDEA).
