

How to manage IntelliJ IDEA projects under Version Control Systems

Depending on the IntelliJ IDEA project format (.ipr file based or .idea directory based), you should put the following IntelliJ IDEA project files under the version control:

.ipr file based format

Share the project **.ipr** file and all the **.iml** module files, **don't share the .iws file** as it stores user specific settings.

.idea directory based format

Share **all the files under .idea directory** in the project root **except the workspace.xml and tasks.xml files** which store user specific settings, also **share all the .iml module files**.
