

I get weird errors "Argument type 'Foo.Bar' is not assignable to parameter type 'Foo.Bar'"

Another symptom of this problem are errors like "Cannot convert source type 'Foo.Bar' to target type 'Foo.Bar'". This problem may happen if you use references to output assemblies of projects instead of (ordinary) references to projects. In such a situation ReSharper is unable to recognize that the types 'Foo.Bar' defined in the project X and in the output assembly of the project X are in fact the same thing, so it underlines that these types are not assignable to each other.

We're going to address this issue in the intermediate version of ReSharper for VS.NET 2003.
