Hi everyone, i'm new in this forum and in the aspectj technology. I'm from Argentina and we speak spanish here, and i'm developing an application.

As you imagine my application GUI has messages in spanish and in spanish we use special characters like accents to vocals and the 'ñ' letter.

I have been working with my application in java with those special characters with no problem, but when i add aspectj to my application all this

characters appear wrong in the screen, this is a problem for me because:

- 1- I have write right in my language
- 2- If i have to change all the special characters in my GUI, it's very complicated.

I hope somebody can help me. Thanks!
