

R# not recognizing web controls when...

Guest

Instead of registering controls in each asp.net page, I have registered them in

R# 4.1.933.3 no longer recognizes any tags or references to Telerik - neither in the code nor the markup.

If I remove the reference from web.config and put the registration back into each individual page R# behaves OK again.

I moved all the references to web.config today because I upgraded to the latest version of Telerik and found myself touching each file to change the references.

Is this a known issue?

Thanks

Jeremy

Jeremy,

that's dead strange. Could you create a complete sample for us, pls?

Sergey,

I closed down VS 2008 and then opened it again. The behaviour I was complaining about disappeared! Further, every time I now open the project I no longer have this issue.

Thinking about it, the problem only arose during the session when I was

R# not recognizing web controls when...

writing the references to web.config and removing the registrations from the individual pages. I guess R# just got confused!

Anyway, now that I know that it just needs a reload of VS it doesn't seem to be an issue any more 😊

However, I also have a very similar issue when I use UserControls with public properties. Around half the time I open the project R# complains that it can't pick up the public properties when the usercontrol is referred to from the page. If I close VS 2008 and then load it again the problem tends to go away. Its impossible to reproduce. While writing this post I've opened the project 10 times and not once has it happened. I'll bet you the moment I press the Send button I'll get this behaviour the next time I open the project!!

Regards

Jeremy
