

Weirdest. Bug. Ever.

Jan 22, 2009

I eagerly installed RubyMine build #784 this morning, and was humming right along until I ran into this jaw-droppingly bizarre bug.

Believe it or not, I can't type some letters in the standard Find or Replace dialogs (Ctrl-Shift-F/R). Most letters work, but certain capital letters just...don't...do anything.

For instance, if I hold down the shift key and type the alphabet, this is what I get:
AGHIJLNQTUVXYZ

I'm on OSX Leopard, 10.5.6.

Sigh - back to the previous release. That's the type of thing that will make a man crazy.

Mike

yep, i confirm see this bug as well. i fixed it by going to preferences, keymap, and change the keymapping back to default mac os. it was using my customized keymapping before (which may have some compatibility problems in the new release).

Weirdest. Bug. Ever.

I tried your solution and it did not work for me. I also tried other Default key maps with no luck.

Brian and Mike,

It also doesn't work on my Mac. I've created an issue for this - see <http://www.jetbrains.net/jira/browse/RUBY-3381>
