

# Code review feature request

It would be very nice to have the ability to bring up a view that lets you select any particular git commit, then shows (a) the files in the commit, and (b) when you select one of the files, the side-by-side full-file diff created by the commit. Essentially, this would be the same view you get when you do a git merge, select a file, and do command-D.

The point is to have the full-file context when reviewing code changes.

Thanks.

Hello Chez,

You can (almost) do this in the current version. From the File History panel, you can select a commit and invoke the "Show All Affected Paths" action.

That gives you a list of all the files in the commit. In the list, you can press Ctrl-D to get a diff dialog showing the changes in the commit. In the diff dialog, you can also use the arrow buttons in the toolbar to move between the files in the commit.

It would be very nice to have the ability to bring up a view that lets

you select any particular git commit, then shows (a) the files in the commit, and (b) when you select one fo the files, the side-by-side full-file diff created by the commit. Essentially, this would be the same view you get when you do a git merge, select a file, and do command-D.

The point is to have the full-file context when reviewing code changes.

Hi Chez,

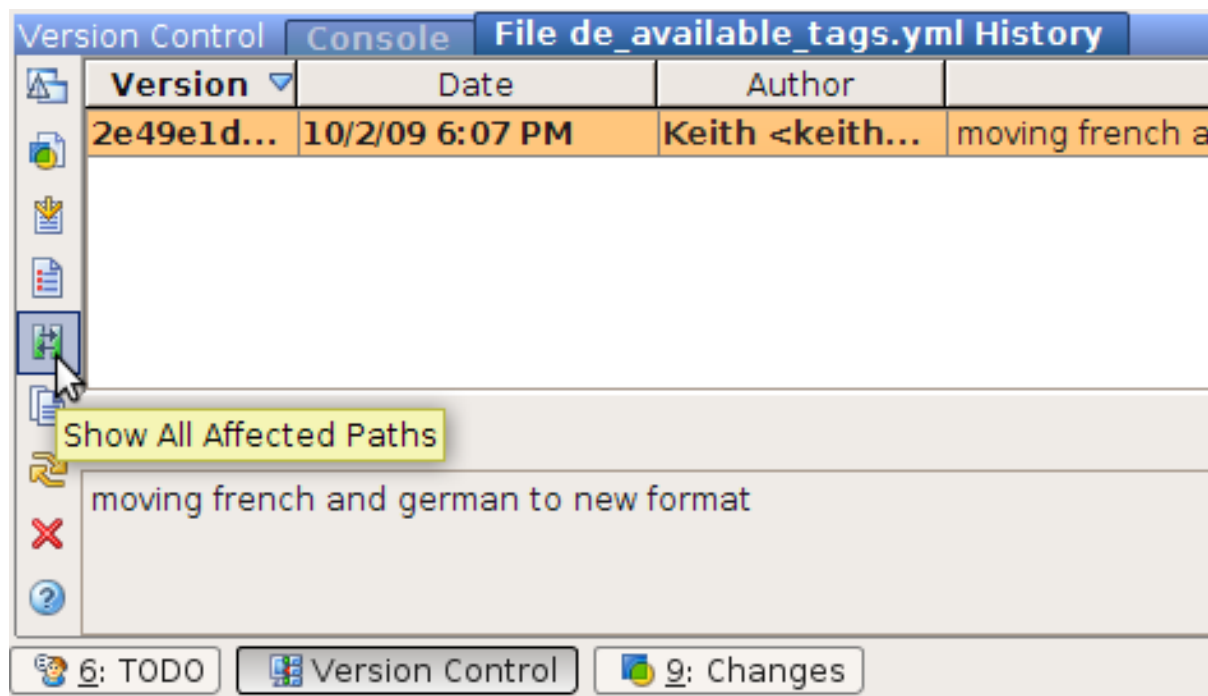

Sounds good... can you tell me how to get to the File History panel?

Here are some screenshots to illustrate Dmitry's advice:

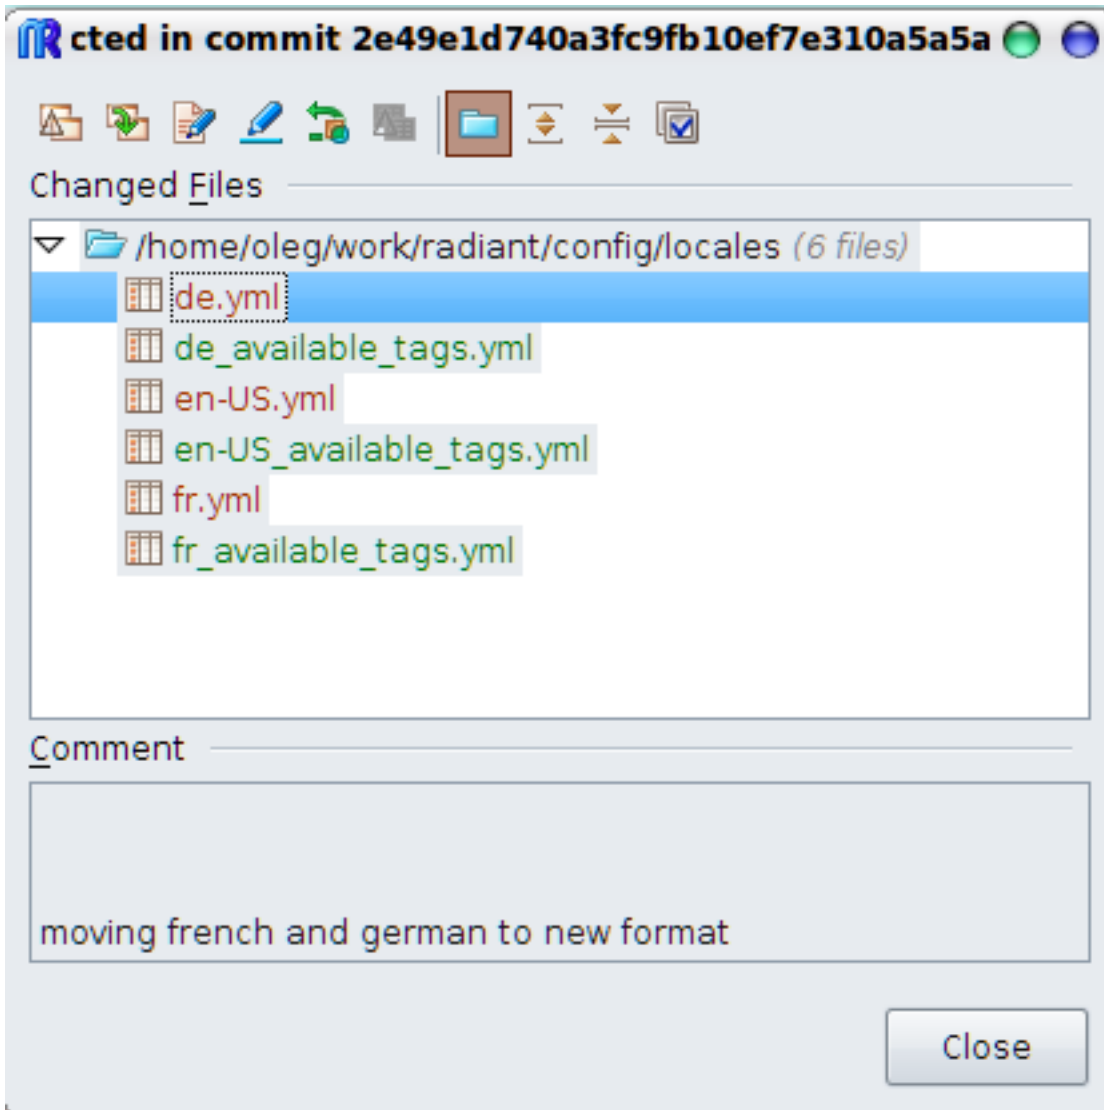

### File History action button

This action will open File History tab within Version Control Tool window, click **Show All Affected Path** action button

And voila - you can review all the available changes!

Thanks for the pointers, this is a useful task to make clear

I do have one request though, if when you provide such explanations for tips could you please provide keyboard shortcuts too? One of the big draws of JetBrains products is the keyboard-centricity of your products.

Code review feature request

For VCS operations we recommend **Version Contol | VCS Quick List..** It's shortcut differs in different keymaps but shortcut is visible in main menu near an action name. VCS Quick list is context sensitive and actions will be applied to 'current' file or all files in project. In popup you can also type number of menu item or it's name for quick access.

That's great!

Thanks.
