

Include "Responsibility Changed" events...

Hi,

Is it possible to add "Responsibility Changed" events to the syndication feeds in TeamCity?

I'm using the syndication feeds to trigger a USB LED lamp (red/green) based on build results and would love to trigger it blue when someone takes responsibility for a build failure.

Hi,

No, it is not supported yet. You can file a feature request in our tracker (<http://youtrack.jetbrains.com/>).

Alternatively, you can trigger a lamp via TeamCity notifications (as how we do actually =)

Include "Responsibility Changed" events...

You wouldn't be using lamps from Delcom, would you? 😊 I have barely been looking at the TeamCity notifications, and not sure where to start actually. I'd guess it would be a notification that can be sent to a remote server (since our TC installation runs in a VM) where the lamps are connected.

To use notifications you need to implement a Notificator interface (<http://javadoc.jetbrains.net/teamcity/openapi/current/jetbrains/buildServer/notification/Notificator.html>) and register it in TeamCity.

The methods of a Notificator are called when certain events in system occur; you can send a HTTP request, or any other remote call in them.

Here are several links to third-party notifiers, could serve you as an example: <http://confluence.jetbrains.net/display/TW/TeamCity+Plugins>

As to our "lamps", we use traffic light =).

Here's a short video about how we tested it: <http://www.youtube.com/watch?v=Y4SNj5ngXXE>

The final configuration is a bit different. There is a simple web-server that can turn on any light, and main the notificator sends HTTP requests to it.

Heh, awesome build indicators! 😊

Include "Responsibility Changed" events...

Thanks for the input, I'll take a look at it and see what I'll do

i needed the same responsible info for the rss feed

i created a new request, since i did not find it one:

<http://youtrack.jetbrains.net/issue/TW-11814?projectKey=TW&query=rss+Responsibility>
