

Help: How to build an artifact...

Dear all,

I am trying to create an artifact dependency. I create it via "Administrator Configuration" -> "Dependencies" -> "Add new artifact dependency". I setup a new artifact dependency with the steps from: <http://www.jetbrains.net/confluence/display/TCD5/5.Dependencies>.

After I created the dependency and tried to check it is correct or not by clicking the "Check artifact dependencies" button, I get the following error:

22:04:36]: Dependency resolving started...

[22:04:36]: Downloading artifacts from: <https://teamcity.dev.real.com/teamcity>

[22:04:36]: Failed to download artifact dependency <My Project :: My Project Name (last pinned build)>: Error looking up artifact dependency.

Cannot find last pinned build in build configuration "My Project :: My Project Name".

This error can be caused by one of the following reasons:

- build referenced in the dependency does not exist
- build configuration does not exist
- build server URL is not specified correctly on the server configuration page
- there is not enough permissions to access this build configuration (jetbrains.buildServer.artifacts.ResolvingFailedException)

[22:04:36]: Failed to download 1 of 1 artifact dependencies

[22:04:36]: Dependency resolving finished

Help: How to build an artifact...

Can someone take a look at this, what's the problem with this? Any reply is highly appreciated!

Thanks

There is message in log:

Cannot find last pinned build in build configuration "My Project :: My Project Name".

Please check that the pinned build is present in specified configuration.

Also please check that user account have enough permissions to access to this build configuration.
