

Event Handler Naming Style

Guest

I am a bit confused about the ReSharper options for event subscription naming settings. If I go to "Naming Style" options and click "Advanced settings...", there are boxes for specifying event handler naming style. For "Event subscriptions on fields", I have specified "On\$object\$\$event\$". However, when I type the following and invoke smart completion:

```
this.Parent.PropertyChanged +=
```

...I get the option to "Create method ParentOnPropertyChanged(object, PropertyChangedEventArgs)". Based on my Naming Style settings, I would expect to see "OnParentPropertyChanged" instead of "ParentOnPropertyChanged". Is this a bug, or are these settings not considered in this scenario?

Thanks,

Mike
