I found it doesn't work with my pre projects, cuz I've been using a lot of static class.

For example: `self::bar=new db(); self::$bar->`(There is no autocomplete).

And it doesn't autocomplete the static function for example:

```
class Foo{  
    static function Bar(){  
    }  
}
```

`Foo::`(there is no autocomplete either)

and I can't autocomplete the static class `F`(no autocomplete)

I think you're wrong. I've just tested what you said and it worked ok. I'm using phpstorm WI-94.506

There is something wrong with the...

```
class Foo{  
  
    static function Bar() {  
  
    }  
  
}
```

foo::

Bar void	model.php
----------	-----------

Choosing item with Tab will overwrite the rest of identifier after caret
